

PorsiPas

Catch the drop. Save the meal.

PorsiPas turns time-sensitive surplus food into nearby **FoodDrops** that students can discover and collect before pickup ends. A physical QR scan verifies each rescue, updates live stock, and unlocks progress only after the backend confirms the action.

1 Problem

Campus events can end with safe, unserved meals while nearby students hear about them too late. Chat-based announcements are easily buried, stock is unclear, and there is no reliable signal that a portion was actually collected.

TIME-SENSITIVE

INVISIBLE STOCK

2 Solution

One standalone app supports both hosts and rescuers. Hosts publish surplus with a photo, portions, pickup point, and deadline. Students find nearby FoodDrops, view live availability, and confirm pickup at the source.

ONE APP

VERIFIED RESCUE

3 The core rescue loop

1

HOST POSTS

Photo, live stock, pickup point, deadline, dietary and allergen details.

2

STUDENT FINDS

List and meteor map show active nearby FoodDrops while the app is open.

3

QR VERIFIES

At pickup, a physical scan asks Supabase to confirm exactly one collection.

4

IMPACT GROWS

Stock falls once; verified history, points, missions, ranks, and badges update.

Why this can change behaviour

PorsiPas makes the sustainable action immediate, visible, and repeatable. Live stock reduces wasted trips; QR verification makes the meaningful event a real collected portion; and PorsiPal progression adds delight without rewarding empty clicks or intentions.

RESCUE FIRST

GAMIFICATION SECOND

LIVE STOCK

ONE SCAN = ONE PORTION

A trustworthy rescue system, not just a feed

The mobile prototype was tested across two physical phones using one shared, server-authoritative Supabase backend.

4 Key features

FAST HOSTING

Anyone can publish and manage a FoodDrop with a photo, stock, pickup information, and deadline.

LIVE DISCOVERY

Students browse a distance-sorted list or meteor map with active status, stock, and timing.

PHYSICAL QR

Atomic backend verification blocks duplicate, expired, cancelled, depleted, and invalid collections.

PRIVATE LOCATION

Foreground-only location supports distance and a user-selected watch radius without exposing users.

STICKY PROGRESS

Verified rescues drive history, impact, weekly missions, streaks, cosmic ranks, and badges.

POLISHED GUIDANCE

PorsiPal celebrations, recoverable states, native sharing, and a 30-second tour support evaluation.

5 Technology and architecture

MOBILE

React Native
Expo SDK 54 and Expo Router
TypeScript
Expo Camera, Location, Image Picker, Notifications

BACKEND

Supabase Auth, Postgres, Storage
Realtime, RLS, and atomic RPCs

MOBILE APP

Host and rescuer

SUPABASE

Auth and RPCs

POSTGRES

Live source of truth

The server is authoritative for collections, remaining stock, points, streaks, and impact. The interface celebrates only a confirmed response.

6 Implementation in the real world

PorsiPas can begin with campus caterers, clubs, residences, and event organisers. A host posts safe unserved portions at the end of an event; nearby students see current availability and collect during the stated window. The same workflow can extend to offices, community events, and partner food-rescue organisations. Operational rollout would add verified host profiles, moderation, production push notifications, and institution-specific food-safety guidance while preserving the QR-confirmed handoff.

ADDITIONAL INFORMATION

No demo password is needed. One anonymous account can both host and rescue. One verified collection is reported as one rescued portion; the prototype does not invent weight, carbon, monetary, or nutritional conversions.

HONEST V1 BOUNDARIES

Location is foreground-only. Expo Go alerts are running-app or local behaviour; production closed-app remote push is deferred. Hosts remain responsible for descriptions, allergens, handling, and food safety.
